Music Room

Using a combination of sensors in the VR headset and in the bodysuit, an AI algorithm builds the virtual environment.

The sensors track information like body temperature, heart rate, and facial expressions.

As the information picked up by the sensors change, the environment created can also change.

Pictures of people or scenery can be preloaded to give the AI more information.

This preloaded information is combined with musical elements such as genre and tempo of the song to create the starting point.

As your room unravels around you, get lost in the musical vibes.

As your body responds to the music and as the music itself changes, your room will evolve and grow!

Features

All your rooms are saved on the cloud where you can easily access and experience it all again!

Music Room also allows you to invite friends and family to experience the room you created. You can even create a room with multiple people!

Your privacy is also very important as music rooms are a private experience. While rooms are stored on the cloud, it is encrypted with you the user holding the key. As a user, you will have total control over who enters your room.

The interactivensness of the rooms means that physical and mental fatigue will naturally discourage users from spending too much time using the rooms. This exhaustion is also directly translated into how rooms are generated furthering this aspect.

Experience
the
musicality of
your mind.

Manifesto

Music Room is designed around how one experiences music. We as humans attach emotions and memories to songs that we listen to.

Building on this experience, Music Room allows a person to be with themselves and fully interact with these emotions.

The system doesn't compound the emotion, but rather, gives the user a new perspective on it. Allowing for a moment of self reflection and self love.

Embrace the music.
Embrace yourself.
